File Structure - Interim POS

Contained within is a general guideline on the file structure of Interim-POS.

Admin: Contains all admin-related files.
Css: Contains all style sheets
Fonts: Contains all fonts
Img: Contains all images
Includes: Assuming Professor wants us to keep PHP here
JS: Contains all JavaScript files
Np: Contains documentation of NewPaltz-related items such as flowcharts. Subfolders are one per member of the team.

  Jennie :
    SQL : Jennie's SQL folder should contain the SQL code for the database

Naming Convention:
This is open to change, but I believe that a suitable naming convention is as follows:

COMPONENT_SPECIFIER.FILETYPE

For example, if the landing page needs a separate login page, the names of the pages would be as follows.

landingPage.php
landingPage_login.php

This allows us to assume the file with no specifiers is the main page and that the specifiers are pages to be navigated to.
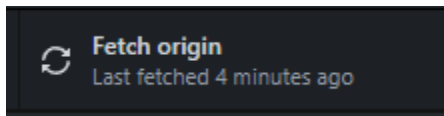

GitHub Guidelines - Interim POS

Contained within is a general guideline on how GitHub will be used.

To upload code to GitHub:

Make a local copy before you do any of this. GitHub is a complex piece of software that is easy to make mistakes with.
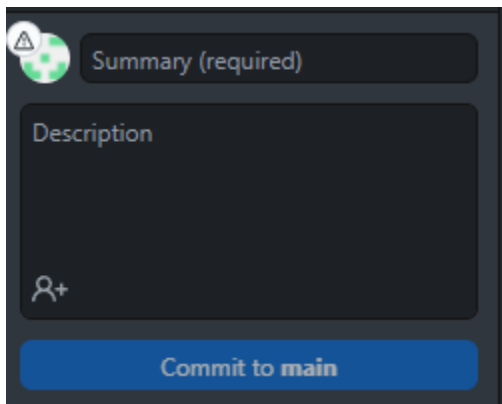

Pull :

This will pull all external changes from the repository to your machine.

Commit :

Fill in the summary and description

Push :

Add the committed changes to the repository
